

# **Operating Systems**

# **Threads and Concurrency**

Seyyed Ahmad Javadi

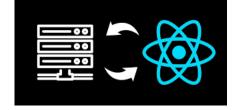

sajavadi@aut.ac.ir

Fall 2022

### **Motivation**

- Most modern applications are multithreaded
- Multiple tasks with the application can be implemented by threads
  - Update display
  - Fetch data
  - Spell checking

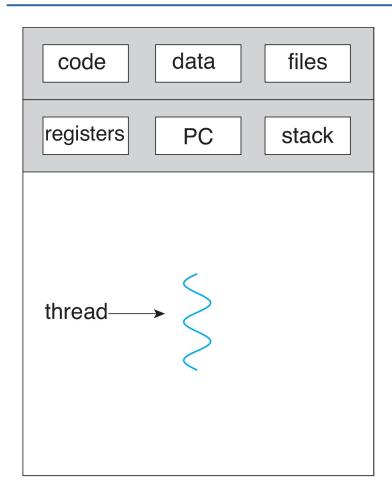

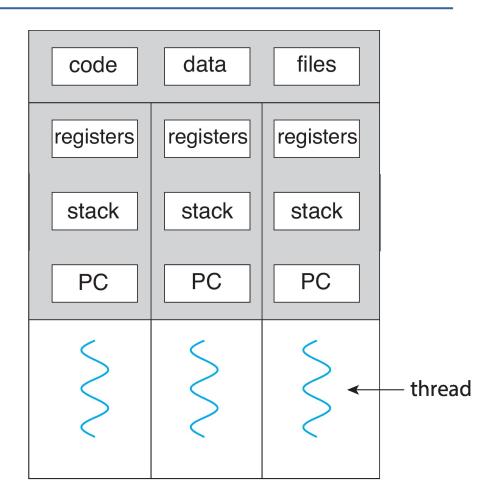

- Process creation is heavy-weight while thread creation is light-weight
- Kernels are generally multithreaded

## Single and Multithreaded Processes

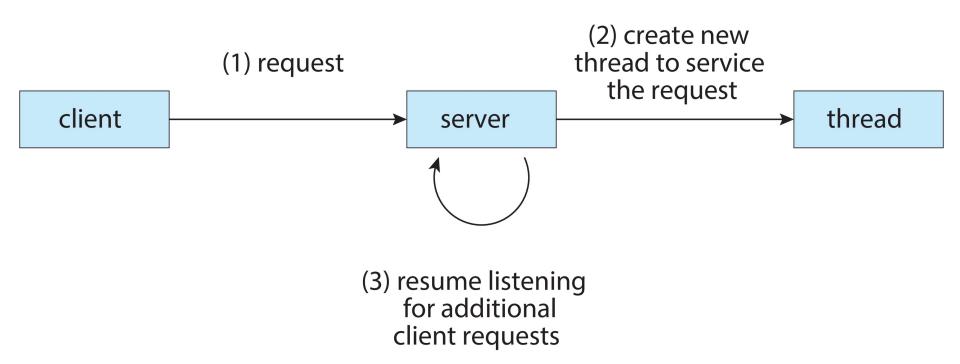

single-threaded process

multithreaded process

### **Multithreaded Server Architecture**

### **Benefits**

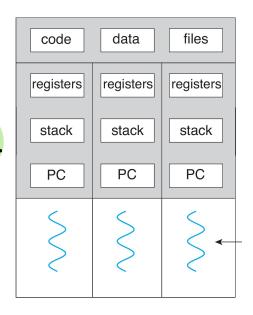

#### Responsiveness

- Allow continued execution if part of process is blocked
- Especially important for user interfaces

#### Resource Sharing

- Threads share resources of process
- Easier than shared memory or message passing.

## Benefits (cont.)

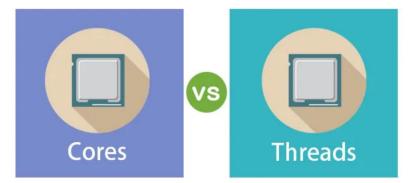

#### Economy

- Cheaper than process creation
- Thread switching lower overhead than context switching.

#### Scalability

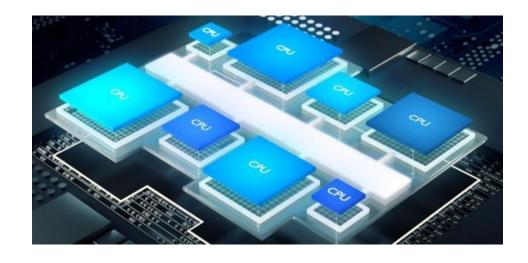

Process can take advantage of multicore architectures.

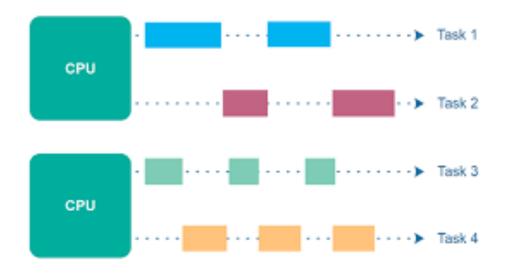

## **Multicore Programming**

- Multicore or multiprocessor systems putting pressure on programmers, challenges include:
  - Dividing activities
  - Balance: ensuring that the tasks perform equal work of equal value.
  - Data splitting
  - Data dependency
  - Testing and debugging

## Multicore Programming (cont.)

Parallelism implies performing more than one task simultaneously

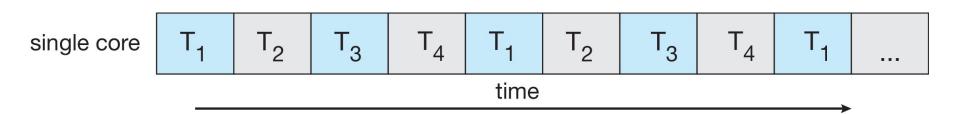

- Concurrency supports more than one task making progress
  - Single processor or core, scheduler providing concurrency

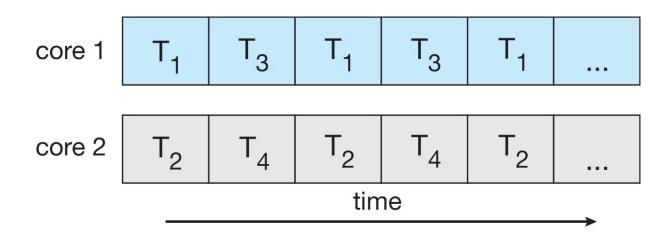

## **Concurrency vs. Parallelism**

Concurrent execution on single-core system:

Parallelism on a multi-core system:

## **Multicore Programming-Types of Parallelism**

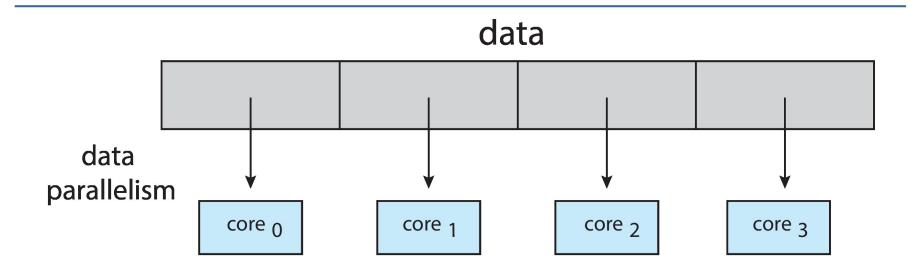

#### Data parallelism

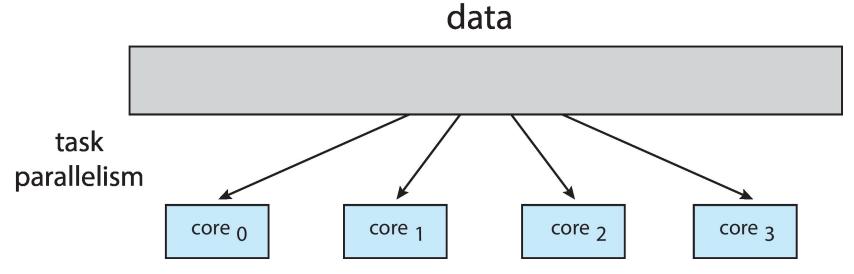

- Distributes subsets of the same data across multiple cores, same operation on each
- Example: summing the contents of an array of size N.

#### Task parallelism

- Distributing threads across cores, each thread performing unique operation
- Example: Unique statistical operation on the array of elements.

### **Data and Task Parallelism**

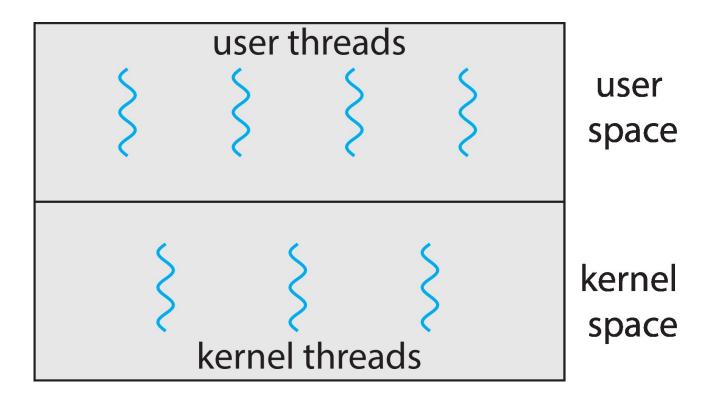

### **User Threads and Kernel Threads**

- User threads: management done by user-level threads library.
- Three primary thread libraries:
  - POSIX Pthreads
  - Windows threads
  - Java threads
- Kernel threads: supported by the Kernel
  - Examples virtually all general -purpose operating systems,
    including: Windows, Linux, Mac OS X, iOS, Android

### **User and Kernel Threads**

Additional review: https://www.geeksforgeeks.org/difference-between-user-level-thread-and-kernel-level-thread/

## **Multithreading Models**

How to map user threads to kernel threads?

- Many-to-One
- One-to-One
- Many-to-Many

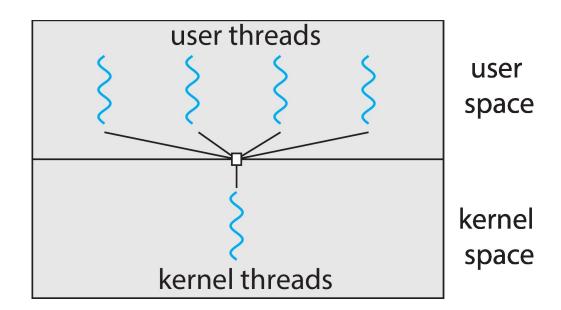

#### Additional review:

https://stackoverflow.com/questions/14791278/threads-why-must-all-user-threads-be-mapped-to-a-kernel-thread

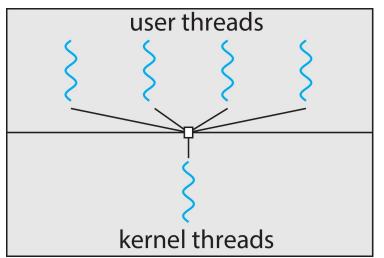

## Many-to-One

- Many user-level threads mapped to single kernel thread
- Thread management is done by the thread library in user space
  - So it is efficient

## Many-to-One (cont.)

- One thread blocking causes all to block
- Multiple threads may not run in parallel on multicore system
  - Because only one may be in kernel at a time
- Few systems currently use this model
- Examples:
  - Solaris Green Threads
  - GNU Portable Threads

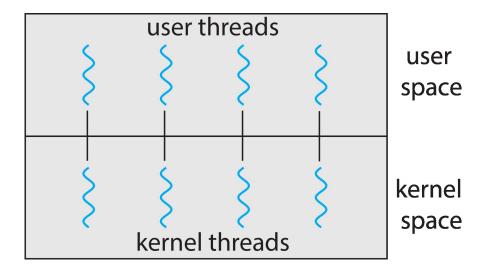

user space

kernel space

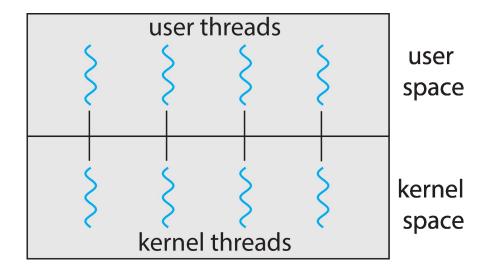

### One-to-One

- Each user-level thread maps to kernel thread
- Creating a user-level thread creates a kernel thread

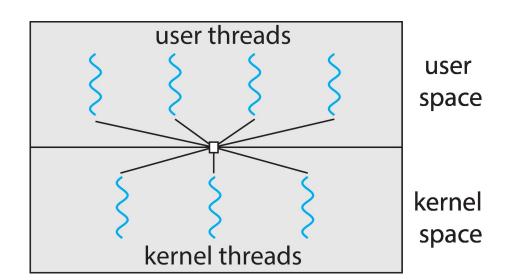

### One-to-One (cont.)

- More concurrency than many-to-one
- Number of threads per process may be restricted due to overhead
- Examples
  - Windows
  - Linux

## **Many-to-Many Model**

- Many user level threads to be mapped to many kernel threads
- Operating system can create a sufficient number of kernel threads

- Examples
  - Windows with the ThreadFiber package
  - Otherwise not very common

### **Two-level Model**

 Similar to M:M, except that it allows a user thread to be bound to kernel thread
